1 The number of cables per phase is based on 90% of the panel nameplate rating. This does not apply to panels rated by MDH. For 100% rated panels, one additional cable per phase and neutral is required. 2000 and 2500 thru 3000, 100% rated panel requires bus duct.
2 Ampacity rating shall be the termination section, pullsection, service section, or main service switch rating, whichever is less.
3 Limited to 30' feet between the transformer secondary spades and customer's switch gear connection point. For greater distances, a bolt-duct is to be used.

- Loads shown in chart have a safety factor of 2
- Based on simple span with adequate lateral bracing using an allowable stress of 21,000 psi(144.7 MPa)
- To determine concentrated load capacity at mid-span, multiply the uniform load by 0.5.
- Use 90% of the solid channel loads for corresponding SH and SHA channels.
- * These back to back channels are only welded.
- Per 2013 CBC Chapter 16, all systems weighing 20 lbs or more suspended from a roof structure,must be seismiced. Per CBC chapter 16, conduits less than 2 1/2" are exempt from seismic requirements.
- Total weight/trapeze(worst case)=255 lbs./rack (8' 4000A GE spectra series alum busway @ 30 lbs/ft = 240 lbs / 8', miscellaneous racking material = 15 lbs).
- Typical trapeze support & seismic detail, w/load calcs. Load calcs are calculated for max. loading (i.e. from new generator to new panel MSB1). All variations to comply w/nec & above loading charts.
- If applicable, submit detail to structural engineer to verify bldg. structure is adequate to support weight.
